

“Dear PIHC Team,

As you know, I have just completed a four week program using the HUBER system, aimed at improving my golf swing, and I am pleased to advise you that my overall mobility and flexibility has improved. I believe that I am hitting the ball 20 to 30 meters further of the Tee and I am not experiencing as much stiffness after the game. I intend to continue with the program on a fortnightly basis and I would be happy to endorse your program to golfers of any age and ability.”

The Huber has the unique ability to target specific muscle chains to promote muscle memory for a particular movement – such as the golf swing.

PIHC has developed a golf program that breaks down the golf swing into its components. A person can then use different positions on the Huber to target the part of their swing that needs improvement. The practitioner is then also able to assess the persons biomechanics at each phase of the swing – and correct during a set program on the Huber.
